

Problem Statement: Adding together two numbers is kinda hard, and it takes up a lot of time.

Design Statement: Design and build an adder that adds together two numbers, each up to 256, on a breadboard.

Criteria/Constraints:

A 555 timer will be used to drive the adder. 7 segment displays will be used as the inputs and outputs.

The clock frequency will be as high as possible. Preferably 1GHz if possible. The faster it is, the faster the calculator will run. (Quicker answer response time)

The calculate button will add the two numbers together.

The circuit will be in an enclosure that displays its inner workings in a multi-level setup that looks like a calculator.
